

◆ General Description

GH1200 series unipolar switch Hall position sensor is designed with CMOS technology.

The input control signal is magnetic induction intensity, output is a switch type digital voltage signal, suitable for working with rectangular or cylindrical magnets. When there is no magnetic field control, the output tube of the sensor circuit in this series will be turned off and the output will be at a high level; When the magnetic field strength B is greater than the operating point (BOP), the output switch tube will open and the output will be at a low level; The output state will remain until the magnetic field strength B is lower than the release point (BRP), at which point the output switch will turn off and the output will return to a high level..
